Riveting New Novel Raises Scary Possibilities

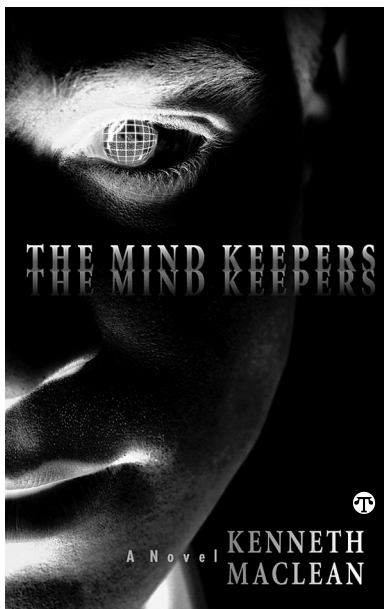

(NAPS)—Is artificial intelligence being used to control your mind? That's the scary premise of an exciting, fast-paced new book, "The Mind Keepers," (New World Press, \$17.95) by Kenneth MacLean.

Although fiction, this riveting novel suggests that American democracy is truly threatened by an interface of computerized radio electronics utilized to manipulate the brain. The process, which has great medical and scientific promise, becomes dangerous in its potential for political control.

The protagonist, Michael Neilly, is a former Army Intelligence officer and FBI agent. Neilly is drawn by a sense of duty into opposition against a mysterious "powercast" facility that is going to be built in a small town in central Washington state.

It was called the Yellow Butte Project, but it had another name more sinister: "Command-Control-Communication-Intelligence System." The author, a trained researcher, uses substantially autobiographical incidents based on his years of personal research into the real and potential abuse of microwave electronics.

He takes the story one step further, suggesting that the technology of electronic stimulus of the brain and personality manipulation (mind control) are starting to happen right here in the United States.

MIND CONTROL—A former Army Intelligence officer discovers that the minds of the people in a small town are being controlled.

Fiction, yes, but the confluence of government, industry and the military (known a generation ago as the military-industrial complex) is alive and well today, especially in terms of radio-microwave technology.
